Section One

GENERAL DESCRIPTION

1.1 GENERAL

OLYMPUS is a diagnostic utility software package for the CONTROL DATA® 1700 Computer. It is useful in the following applications:

1. General software debugging
2. Standard peripheral communications
3. Hardware unit testing

OLYMPUS is composed of an executive, a high-level language interpreter, and a variable set of processing routines which define the mnemonic instruction language.

OLYMPUS is operated in a conversational mode through the 1711, 1712, or 1713 Teletypewriter (TTY). Mnemonic statements which define some specific operation are input via the TTY and executed.

OLYMPUS is operated in one of two modes: Direct or Indirect. In the Direct mode a sub-processor is called with a TTY statement and executed immediately. The Indirect mode allows a sequence of sub-processors to be defined by the operator using the OLYMPUS language and then executed on command.

For general software debugging and standard peripheral communications, OLYMPUS includes processors which dump core, load core, read paper tape, punch paper tape, search core for pattern, read/write magnetic tape, etc.

For hardware testing, OLYMPUS includes basic instructions such as Read, Write, Type Message, and Define Variable, as well as higher order instructions for specific hardware such as Read Digital Input and Read Analog Input.

OLYMPUS makes available to the user a high-order FORTRAN-like language which easily facilitates the writing, debugging, and modification of simple hardware diagnostics. The language is self-documenting and can be input, edited, saved, reloaded, or executed via the Teletype.

Modules written for the UTOPIA 1700 Console Debugging Package may be operated under OLYMPUS with restriction. The systems utilize a different technique to pass parameters, and as a result dynamic changing of variables is not allowed with UTOPIA modules operated under OLYMPUS control.

1.2
HARDWARE
REQUIRED

The minimum hardware configuration for OLYMPUS requires:

1700 Computer with 4096-word core and 1705 Interrupt/Data Channel

Teletypewriter: Model 1711, 1712, or 1713 to use as a comment medium

Input Device: 1712 or 1713 TTY Paper Tape Reader, 1721 Paper Tape Reader, or 1729 Card Reader

In expanded form, OLYMPUS may operate the following I/O equipment:

1705 Interrupt/Data Channel

1750 Data and Control Terminal (DCT)

1721 Paper Tape Reader

1723 Paper Tape Reader

1729 Card Reader

405 Card Reader

1731 Magnetic Tape Controller and 601 Tape Transport Units

8000 High-Speed Magnetic Tape Controller and 800 Tape Transport Units

1738 Disk Drive Controller and 853/4 Disk Drive Units

1751 Drum Interface and Storage Units

Units operating on a 1797 Buffered I/O Interface

1739 Disk

1752 Drum

1742 Line Printer

1728/430 Card Reader/Punch

1.3
SOFTWARE
REQUIRED

The minimum software configuration for OLYMPUS requires the following six modules:

OLOPIA	84967900
OLYMPY	84968100
OL1711 or OL1713 or OL1712	84968000/39267000/39567600
OLYREJ	84968200
OLMANF	39266900
UTLAST	84961300

Any of the additional OLYMPUS modules may be added to the above required modules to produce the desired software package.

Section Two

OPERATION

2.1 GENERAL

OLYMPUS is supplied to the user as a modular package. It is loaded into the computer at a location of convenience by a bootstrap operation. This section describes:

1. Loading OLYMPUS
2. Direct mode of operation
3. Indirect mode of operation
4. OLYMPUS statement set
5. Generating new OLYMPUS routines

2.2 LOADING THE OLYMPUS PROGRAM

OLYMPUS paper tapes are available in either absolute or relocatable binary formats. (See paragraph 2.2.6.) The absolute form is a run-anywhere, binary format record and may be loaded into core by a bootstrap operation at cell location \$200 or above. The relocatable binary format tapes must be read into the computer and absolutized by a loader operation (refer to paragraphs 2.2.4 and 2.2.5). After these operations, an absolute tape can be produced. The following routines load the OLYMPUS PROGRAM:

OPERATION	PROCEDURE
2.2.1 START THE 1700 COM- PUTER AND NECESSARY PERIPHERALS	Follow the normal starting procedures for the computer and selected peripherals.
2.2.2 LOAD THE BOOTSTRAP INSTRUCTION SEQUENCE MANUALLY The loading addresses run sequentially and are deter- mined by the initial setting	<ol style="list-style-type: none">1. Select the P-register.2. Set the P-register to hhhh. This is the arbitrary starting address of the bootstrap. It must be selected so the tape being input is not read over the bootstrap.3. Select the X-register.

OPERATION	PROCEDURE
<p>2. 2. 3 LOAD THE OLYMPUS ABSOLUTIZED PAPER TAPE</p> <p>The P-register is set to the start of the bootstrap and the A-register set to the first word address minus one in core where OLYMPUS is to be loaded.</p>	<ol style="list-style-type: none"> 1. Insert the absolute OLYMPUS paper tape in the paper tape reader (PTR). 2. Verify that the reader is on. 3. Press the PTR CLEAR switch. 4. Set P = hhhh (Start of bootstrap). 5. Set A = first word address -1. 6. Momentarily step the STEP/RUN switch to RUN. The paper tape will completely load. If the tape should stop before completely loading, some mistake has occurred during the operation. In this event, re-wind the tape, clear the computer, and begin again at the start of the bootstrap. 7. To use the loaded OLYMPUS program see Section 2. 3.
<p>2. 2. 4 LOADING AND ABSOLUTIZING OLYMPUS IN RELOCATABLE TAPE FORMAT</p> <p>This method loads an absolutized OLYMPUS package in upper core and then uses it to load and link new relocatable modules of OLYMPUS. The modules will be loaded consecutively starting at the selected address and absolutized at their relative loading location.</p>	<ol style="list-style-type: none"> 1. Enter the bootstrap of paragraph 2. 2. 2 at \$ [End core - (length of loading package) - 10]. 2. Load an absolutized OLYMPUS tape, which contains an OLSILY module, into the Paper Tape Reader. Press the PTR CLEAR switch. 3. Set the P-register to the bootstrap starting address, i. e. , \$ [End core - (length of loading package) - 10]. 4. Set the A-register to the address minus one of the location at which the tape is to be loaded, i. e. , \$ [End core - (length of loading package) - 1]. 5. Momentarily set the STEP/RUN switch to RUN. The tape will load at the address specified in step 4. 6. Set the P-register to the beginning address of OLYMPUS (i. e. , next cell above the address specified in step 4 above). Step the STEP/RUN switch to RUN. The program now enters OLYMPUS which will be used to load and link the relocatable OLYMPUS modules.

OPERATION	PROCEDURE																		
2. 2. 4 (Continued)	<p>7. Place the relocatable OLYMPUS tapes in the Paper Tape Reader and use the mnemonics of the OLSILY module (described in Table 2. 1t) to load and link the modules. OLOPIA must be the first module loaded; UTLAST must be the last. The remainder of the modules may be in any order.</p> <table style="margin-left: 100px;"> <tr> <td style="padding-right: 20px;">First module</td> <td style="padding-right: 20px;">}</td> <td>OLOPIA</td> </tr> <tr> <td style="padding-right: 20px;">.</td> <td></td> <td></td> </tr> <tr> <td style="padding-right: 20px;">.</td> <td></td> <td></td> </tr> <tr> <td style="padding-right: 20px;">.</td> <td></td> <td></td> </tr> <tr> <td style="padding-right: 20px;">Last module</td> <td style="padding-right: 20px;">}</td> <td>Any Order</td> </tr> <tr> <td></td> <td></td> <td>UTLAST</td> </tr> </table> <div style="text-align: center; border: 1px solid black; width: fit-content; margin: 20px auto; padding: 5px;">NOTE</div> <p>OLYMPUS makes reference to the I-register (location \$FF in core); because some routines require use of the interrupt trap region (locations \$100-\$140), the OLYMPUS should be loaded at cell location \$200 or above.</p> <p>9. After the modules are loaded and linked, the operator may punch an absolutized binary tape by using the Punch Paper Tape (PPP) command on the newly loaded OLYMPUS program.</p>	First module	}	OLOPIA	.			.			.			Last module	}	Any Order			UTLAST
First module	}	OLOPIA

Last module	}	Any Order																	
		UTLAST																	
2. 2. 5 LOADING AND ABSOLUTIZING RELOCATABLE OLYMPUS TAPES WITH AN OPERATING SYSTEM OR UTILITY SYSTEM LOADER	<p>If other relocating loaders have been previously entered in the computer, it may be preferable to use them. Methods of loading and absolutizing tapes with these loaders will be found in the following references:</p> <p style="text-align: center;">OPERATING SYSTEM REFERENCE MANUAL Publication No. 60174600</p> <p style="text-align: center;">UTILITY SYSTEM REFERENCE MANUAL Publication No. 60172300</p>																		

OPERATION	PROCEDURE
2. 2. 6 ORDERING INSTRUCTIONS	<p>OLYMPUS resides in the software library at SCDD (Small Computer Development Division). OLYMPUS is composed of a series of programs which can be linked as specified by the user to produce a wide range of capability.</p> <p>To order a copy of OLYMPUS from SCDD library, it is necessary to furnish the information shown on the example Job Request Form.</p>

	<p>For requests generated outside SCDD, a memo or TWX containing the above information directed to Computer Services, will suffice. A charge number must be included. The user can order either an absolute tape as shown, or individual relocatable binary tapes to be loaded by the user as specified in paragraph 2. 2. 4.</p>
--	---

OPERATION	PROCEDURE
<p>2.3 DIRECT MODE OF OPERATION</p> <p>2.3.1 EXECUTING OLYMPUS IN DIRECT MODE WITH TTY KEYBOARD CONTROL</p> <p>In direct mode, each state- ment is executed imme- diately upon entry from the TTY.</p> <p>Execution is initiated by the Carriage Return.</p> <p>ERROR MESSAGE INTERPRETATION</p>	<ol style="list-style-type: none"> 1. With OLYMPUS loaded, step the RUN/STEP switch and MASTER CLEAR. 2. Set the P-register to the beginning address of OLYMPUS and momentarily set the RUN/STEP switch to RUN. The TTY replies with a Line Feed, Carriage Return, Bell (LF, CR, B). The OVERFLOW light on the computer console will be flashing on and off indicating OLYMPUS is in the idle loop waiting for input instructions via the TTY. 3. To execute an OLYMPUS operation, a valid OLYMPUS statement (see Section 2.5) of the following format must be entered via the TTY: <p style="text-align: center;">MNE, field 1, field 2, . . . , field 8 (cr)</p> <p>Where MNE is a mnemonic with up to four letters followed by the field quantities for the particular statement entered.</p> <p>A statement may have a maximum of eight fields, except for the continuation fields of the LHX statement. The statement is terminated by a Line Feed, Carriage Return ((cr)).</p> <p>Execution of the statement is begun when the Carriage Return has been received from the TTY. The completion of the operation will be signaled by a (LF, CR, B) output to the TTY, and the OVERFLOW LIGHT on the computer console flashing. OLYMPUS is in an idle loop waiting for further instructions. If the Processor Error Exit is taken, the following message will be typed out before returning to the idle loop:</p> <p style="text-align: center;">PROCESSOR ERROR EXIT</p> <p>The following messages will be output on the TTY if an error is made in the input statement:</p> <p style="text-align: center;">NOT MNEMONIC</p>

OPERATION	PROCEDURE												
STATEMENT FIELDS (Continued)	<p>3. Parentheses</p> <p>Parentheses, in conjunction with hexadecimal values or labeled storage, are used as a means of indirectly addressing cells. Two levels of indirect addressing are available for hexadecimal values. One level is available for labeled storage locations (because labeled storage itself already implies one level of indirect addressing).</p> <p>Examples:</p> <p>The following table defines the five possible combinations that are provided for specifying quantities. hhhh is a hexadecimal number and In is one of the labeled storage locations.</p> <table border="0" data-bbox="649 924 1266 1344"> <thead> <tr> <th style="text-align: center;"><u>Field</u></th> <th style="text-align: center;"><u>Operand</u></th> </tr> </thead> <tbody> <tr> <td>hhhh</td> <td>hhhh (hexadecimal number)</td> </tr> <tr> <td>(hhhh)</td> <td>Contents of hhhh</td> </tr> <tr> <td>((hhhh))</td> <td>Contents of the cell whose address is specified in hhhh</td> </tr> <tr> <td>In</td> <td>Contents of the cell associated with In</td> </tr> <tr> <td>(In)</td> <td>Contents of the cell whose address is specified in the cell associated with In.</td> </tr> </tbody> </table> <div style="text-align: center; border: 1px solid black; width: fit-content; margin: 10px auto; padding: 5px;"> CAUTION </div> <p>In OLYMPUS statements with field parameter designated by h_i, specifying the parameters as hhhh has no meaning when that field defines a location into which data is to be stored. hhhh is interpreted as a hexadecimal number and not a core location. Any of the other four formats are meaningful.</p>	<u>Field</u>	<u>Operand</u>	hhhh	hhhh (hexadecimal number)	(hhhh)	Contents of hhhh	((hhhh))	Contents of the cell whose address is specified in hhhh	In	Contents of the cell associated with In	(In)	Contents of the cell whose address is specified in the cell associated with In.
<u>Field</u>	<u>Operand</u>												
hhhh	hhhh (hexadecimal number)												
(hhhh)	Contents of hhhh												
((hhhh))	Contents of the cell whose address is specified in hhhh												
In	Contents of the cell associated with In												
(In)	Contents of the cell whose address is specified in the cell associated with In.												

OPERATION	PROCEDURE
<p>STATEMENT FIELDS (Continued)</p> <p>Terminating input.</p> <p>Loading a previous saved program is done in direct mode.</p>	<p>1. Note that the decimal point is a separator rather than a true decimal point, i. e.,</p> <p>1. 1</p> <p>1. 10 .1 = 1</p> <p>1. 11 .2 = 2</p> <p>1. 90 .10 = 10</p> <p>1. 99 .01 = 1</p> <p>2. 0</p> <p>A space is <u>required</u> to terminate the statement number before the mnemonic and field portion are begun. The format of the statement is therefore:</p> <p style="text-align: center;">m.n MNE, field 1, field 2, . . . , field 8 (cr)</p> <p>2. The user continues to enter the program statements in a sequential order while in the Input mode.</p> <p>3. At the point in the program sequence where the operation is completed, the EXIT statement must be included in the program to cause a normal return to OLYMPUS. It has the following format:</p> <p style="text-align: center;">m.n EXIT (cr)</p> <p>4. When all program statements have been entered, the Input routine is terminated by typing:</p> <p style="text-align: center;">END (cr)</p> <p>The input operation is terminated and the buffer size is output on the TTY in the following format:</p> <p style="text-align: center;">INPUT BUFFER FROM XXXX TO YYYY XXXX is the first buffer address YYYY is the last buffer address</p> <p>The user may save the program sequence by outputting it on some storage medium. It can be reloaded and run by any OLYMPUS package with the proper modules to handle the mnemonics in the program sequence.</p> <p>If the user has a program sequence saved on some storage medium, it may be read in using the OLYMPUS routines. The beginning of the input buffer area can be located by typing in the statements that follow.</p>

OPERATION	PROCEDURE
<p>STATEMENT FIELDS (Continued)</p>	<p>INPT (cr) END (cr)</p> <p>The input termination message will be output on the TTY with the first buffer address equal to the last buffer address.</p> <p>If an error is made while inputting a statement, a question mark followed by a line feed and carriage return deletes the statement.</p> <p>If an error causes an exit from the input processor routine, the user may continue inputting the program by using the EDIT statement. Failing to terminate the statement number with a space is one error that causes an exit. The error exit causes an "INPUT FORMATTING ERROR" message and an exit from the input processor.</p>
<p>2.4.2 EXECUTING PROGRAM SEQUENCE</p>	<p>To begin execution of the program in the input buffer, the user types:</p> <p>EXEC, NUM (cr)</p> <p>OLYMPUS begins processing the program sequence and begins execution at statement number NUM. If NUM is omitted, execution will begin at the lowest statement number in the program.</p> <p>One of the following mnemonics will be output if an error causes an exit during the processing of the statements:</p> <p>NOT MNEMONIC</p> <p>One of the mnemonics is invalid or not linked to the OLYMPUS package being used;</p> <p>MODE ERROR</p> <p>An invalid indirect mode mnemonic is in the program sequence. (See NOTE.);</p> <p>STATEMENT NO UNPATCHED</p>

OPERATION	PROCEDURE
	<p>One of the instructions that transfer control to other statement number locations was given a statement number that is not in the program sequence.</p> <div style="text-align: center; border: 1px solid black; width: fit-content; margin: 10px auto; padding: 2px;">NOTE</div> <p>Any of the following statements are illegal if requested in the Direct mode of operation:</p> <p style="text-align: center;">IFGT, IFEQ, IFLT, IFNE, IFSK GOTO, EXIT, END, MSG, INT</p> <p>Any of the following statements are illegal if requested in the Indirect mode of operation:</p> <p style="text-align: center;">INPT, EXEC, EDIT, LIST</p>
<p>2. 4. 3 CHANGING PROGRAM SEQUENCE</p>	<p>To modify statements in the program or to add statements to the program, the EDIT statement is used:</p> <p style="text-align: center;">EDIT (cr)</p> <p>This mnemonic puts OLYMPUS in the input mode. It is used in the same manner as the INPT statement, except that it saves the statements that are already in the input buffer. It is terminated with the END statement and gives the same termination message.</p> <p>SAMPLE PROGRAM</p> <p>The following example shows how the various statements may be used. A line feed and carriage return terminate each line. Under line indicates computer printout.</p> <p>INPT</p> <ol style="list-style-type: none"> 1. MSG, CONTACT CLOSURE INPUT SCAN TEST 2. MSG, DEFINE THE FOLLOWING INPUTS 3. DEFN, X, Y, J, M

OPERATION	PROCEDURE
2. 4. 3 (Continued)	<p>4. STOR, O, H 4. 1 STOR, X, G 4. 2 STOR, Y, H 5. RDGI, G, H 6. TYPE, G, H 7. STOR, H, (J) 8. IFEQ, G, K, 12. 9. ADD, G, 1, G 10. ADD, J, 1, J 11. GOTO, 5. 12. STOR, X, G 13. 2. 5 OLYMPUS STATEMENT SET	<p>The statement set of any particular OLYMPUS program depends on the particular modules used to build the program. The basic statement set consists of those mnemonics in the required modules. This section gives a description of the mnemonics available in OLYMPUS. They are arranged according to the modules in which they are contained.</p>

Table 2. 1a. OLOPIA Module (1 Subroutine)

PROGRAM NO. 849679XX
 EQUIPMENT: Mainframe, TTY

CORE SIZE: \$260

MNEMONIC AND CALL	OPERATION
LST (cr)	<p><u>LIST ALL LINKED MNEMONICS IN PACKAGE</u></p> <p>Each linked mnemonic in the program is output on the TTY followed by two hexadecimal values. The first value is the starting address of the module in which the mnemonic is located. The second value gives the address of the mnemonic relative to the starting address of the module.</p>

Table 2. 1b. OLYMPY Module (28 Subroutines)

PROGRAM NO. 849681XX
 EQUIPMENT: Mainframe, TTY

CORE SIZE: \$66F

MNEMONIC AND CALL	OPERATION
ADD, h_1, h_2, h_3 (cr)	<p><u>ADDITION</u></p> <p>The value specified by h_1 is added to the value specified by h_2. The sum is stored at the address specified by h_3.</p> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;">NOTE</div> <p>In this and the following tables, h_i may refer to a hexadecimal number, a labeled storage location, or an indirect address. If h_i is used to specify a cell into which a value is to be stored, it may not be a hexadecimal number. (See Statements Fields, page 2.7.)</p>
SUB, h_1, h_2, h_3 (cr)	<p><u>SUBTRACTION</u></p> <p>h_1 minus h_2 is stored at h_3.</p>
MUI, h_1, h_2, h_3 (cr)	<p><u>MULTIPLY</u></p> <p>h_1 multiplied by h_2 is stored at h_3.</p>
DVI, h_1, h_2, h_3 (cr)	<p><u>DIVIDE</u></p> <p>h_1 divided by h_2 is stored at h_3.</p>
EOR, h_1, h_2, h_3 (cr)	<p><u>EXCLUSIVE OR COMPARISON</u></p> <p>The "Exclusive Or" comparison of h_1 and h_2 is stored at h_3. This is a bit-by-bit comparison of h_1 and h_2. The corresponding bit in h_3 is set only if the bit in h_1, or the bit in h_2 is set. The bit in h_3 will not be set if both h_1 and h_2 are set.</p>

Table 2. 1b. OLYMPY Module (28 Subroutines) (Continued)

EQUIPMENT: Mainframe, TTY

MNEMONIC AND CALL	OPERATION
<p>AND, h₁, h₂, h₃ (cr)</p>	<p><u>AND COMPARISON</u></p> <p>The "And" comparison of h₁ and h₂ is stored at h₃. This is a bit-by-bit comparison of h₁ and h₂. The corresponding bit in h₃ will be set only if the bit in h₁ and the bit in h₂ are set.</p>
<p>OR, h₁, h₂, h₃ (cr)</p>	<p><u>INCLUSIVE OR COMPARISON</u></p> <p>The "Inclusive Or" comparison of h₁ and h₂ is stored at h₃. This is a bit-by-bit comparison of h₁ and h₂. The corresponding bit in h₃ will be set if the bit in h₁ is set, or the bit in h₂ is set, or both are set.</p>
<p>STOR, h₁, h₂ (cr)</p>	<p><u>STORE VALUE</u></p> <p>The value specified by h₁ is stored at h₂.</p>
<p>RTJ, Core location, Q, A, I, M (cr)</p>	<p><u>RETURN JUMP</u></p> <p>Return jump to the core location specified with the parameters set. If M is dropped from the input list, the M-register will remain at its present value.</p> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;">NOTE</div> <p>In all IF statements +0 (0000) is equal to -0 (FFFF).</p>
<p>IFGT, h₁, h₂, NUM (cr) (Indirect mode only)</p>	<p><u>LOGICAL "IF GREATER THAN"</u></p> <p>If h₁ is greater in value than h₂, go to statement number specified by NUM; if not, go to next highest statement number.</p>

Table 2.1b. OLYMPY Module (28 Subroutines) (Continued)

EQUIPMENT: Mainframe, TTY

MNEMONIC AND CALL	OPERATION
IFEQ, h ₁ , h ₂ , NUM (cr) (Indirect mode only)	<p><u>LOGICAL "IF EQUAL"</u></p> <p>If h₁ is equal in value to h₂, go to statement number specified by NUM; if not, go to next highest statement number.</p>
IFLT, h ₁ , h ₂ , NUM (cr) (Indirect mode only)	<p><u>LOGICAL "IF LESS THAN"</u></p> <p>If h₁ is less than h₂ in value, go to statement number specified by NUM; if not, go to next highest statement number.</p>
IFNE, h ₁ , h ₂ , NUM (cr) (Indirect mode only)	<p><u>LOGICAL "IF NOT EQUAL"</u></p> <p>If h₁ is unequal in value to h₂, go to statement number specified by NUM; if not, go to next highest statement number.</p>
IFSK, NUM (cr) (Indirect mode only)	<p><u>IF SKIP SWITCH SET, GO TO NUM</u></p> <p>If the Selective Skip switch on the computer console is set, control will transfer to the statement number NUM. If the switch is not set, control will continue with the next highest statement number.</p>
GOTO, NUM (Indirect mode only)	<p><u>TRANSFER CONTROL TO STATEMENT NUMBER NUM</u></p> <p>Direct transfer to statement number NUM.</p>
PAUS, h (cr)	<p><u>PAUSE AND TYPE h</u></p> <p>This statement causes the execution of the input buffer to pause and print the value of h. Execution will continue when the operator types in a carriage return.</p>

Table 2.1b. OLYMPY Module (28 Subroutines) (Continued)

EQUIPMENT: Mainframe, TTY

MNEMONIC AND CALL	OPERATION
<p>DELY, h (cr)</p>	<p><u>DELAY FOR h*100 μSEC.</u></p> <p>This statement causes a delay of h*100 μsec to occur while in this statement processor. The time required to access this statement processor (about 50 μsec) is not included.</p>
<p>EXIT (cr) (Indirect mode only)</p>	<p><u>EXIT FROM PROGRAM TO OLYMPUS IDLE LOOP</u></p> <p>This statement gives the normal exit from the program sequence.</p>
<p>DEFN, ln, ln, . . . (cr)</p>	<p><u>DEFINE LABELED STORAGE</u></p> <p>This statement permits the user to define labeled storage in a conversational mode. On execution of this statement, OLYMPUS types out ln = . It then waits in a Read mode for the operator to specify a value of ln. This operation continues until all labeled storage specified is defined. Example (underline indicates computer printout):</p> <p style="padding-left: 40px;">Statement: DEFN, G, H (cr)</p> <p style="padding-left: 40px;">Printout: <u>G = 1234</u> (cr)</p> <p style="padding-left: 40px;"><u>H = 5678</u> (cr)</p> <p>Indirect addressing (parenthesis) is not permitted.</p>
<p>TYPE, ln, ln, . . . (cr)</p>	<p><u>TYPE OUT LABELED STORAGE VALUES</u></p> <p>This statement permits the contents of labeled storage to be output on the TTY as follows.</p> <p style="padding-left: 40px;">ln=h₁h₁h₁h₁ ln=h₂h₂h₂h₂</p> <p>Printing continues across the page until all parameters specified are output, or until a maximum of eight parameters are printed.</p> <p>Indirect addressing (parentheses) are not permitted.</p>

Table 2.1b. OLYMPY Module (28 Subroutines) (Continued)

EQUIPMENT: Mainframe, TTY

MNEMONIC AND CALL	OPERATION
<p>MSG, MESSAGE (cr)</p> <p>INPT (cr)</p> <p>END (cr)</p>	<p><u>OUTPUTS MESSAGE COMMENT</u></p> <p>This statement permits comments to be added. The comment begins immediately following the comma mnemonic terminator, and may be up to 60 characters in length. Execution of the statement causes the comment to be printed. The rubout character, ?, is still operative in the comment and therefore cannot be part of the message.</p> <p><u>INITIATE INPUT MODE</u></p> <p>OLYMPUS is ready to receive program statements from the TTY and place them in the input buffer for later execution. Before each statement is requested, its block in the input buffer is zeroed out. Each acceptable statement becomes the last statement in the sequence. Statements are rejected if the statement number has an incorrect format. When an unacceptable statement is rejected, input is terminated, an error message output, and control returned to the idle loop. At this point, the EDIT statement may be used to continue input.</p> <p><u>TERMINATE INPUT</u></p> <p>This statement terminates loading of the input buffer by the INPT module. It must be the last statement of the sequence, and it requires no statement number. The beginning and the end of the input buffer are printed out following this statement. The message format is:</p> <p>INPUT BUFFER FROM (FIRST) TO (LAST)</p> <p>With this information the input buffer may be saved on some storage medium using OLYMPUS output statements. By typing the following sequence, the terminate message will be printed with (first = last)</p> <p style="padding-left: 40px;">INPT (cr)</p> <p style="padding-left: 40px;">END (cr)</p> <p>This locates the buffer address for loading purposes.</p> <p>The END statement is handled special by OLYMPUS and does not list under the LST statement in the OLOPIA module. (See Section 2.5, Table 2.1a.)</p>

Table 2.1b. OLYMPY Module (28 Subroutines) (Continued)

EQUIPMENT: Mainframe, TTY

MNEMONIC AND CALL	OPERATION
LIST, NUM1, NUM2 (cr)	<p><u>LIST PROGRAM SEQUENCE</u></p> <p>A complete or partial listing of the program in the input buffer is output on the TTY.</p> <p>NUM1 = Start listing with statement number NUM1 NUM2 = Stop listing with statement number NUM2</p> <p>If no parameters are entered a complete listing is obtained. If NUM1 but not NUM2 is entered, the listing begins with NUM1 and goes to the end. If both NUM1 and NUM2 are entered, the listing begins at NUM1 and ends with NUM2. Example:</p> <p>LIST, 10.0, 13.0</p>
EDIT (cr)	<p><u>ENTER INPUT MODE WITH BUFFER SAVED</u></p> <p>Statement causes the INPT module to be initialized to add statements to the existing input buffer. Editing an existing statement results in the corrected statement replacing the existing statement. The END statement is used to terminate input.</p>
EXEC, NUM (cr)	<p><u>EXECUTE PROGRAM IN INPUT BUFFER</u></p> <p>Processing and execution of the program in the input buffer is initiated at statement number NUM. If NUM is omitted, execution begins at the lowest statement number in the program.</p> <p>The manual interrupt on the TTY causes termination of execution and return of control to the idle loop. Manual interrupt is only processed in the EXEC module. Control returns to the EXEC module between the execution of each statement.</p>
INT, h ₁ , h ₂ , h ₃ , h ₄ , NUM (cr) (Indirect mode only)	<p><u>INTERRUPT HANDLING</u></p> <p>Where: h₁ = Value to be loaded into the M-register. h₂ = Delay or wait for interrupt h₂ times 100 microseconds. Positive number only.</p>

Table 2.1b. OLYMPY Module (28 Subroutines) (Continued)

EQUIPMENT: Mainframe, TTY

MNEMONIC AND CALL	OPERATION
<p>INT, h_1, h_2, h_3, h_4, NUM (cr) (Continued) (Indirect mode only)</p>	<p>h_3 = Core location where number of interrupting line (0-F) is stored.</p> <p>$h_4 = 0$, store line number in location specified by h_3.</p> <p>$h_4 \neq 0$, type line number and store line number in location specified by h_3. Format of message is: "INT LINE XX" where $0 \leq XX \leq 15$.</p> <p>NUM = Statement number to which exit will be made if <u>no</u> interrupt occurs during delay time.</p> <p>This statement loads the mask register (M) with the value of h_1, sets up all 16 interrupt trap regions, enables interrupts, and waits in a delay loop whose time is specified by h_2. If an interrupt occurs while in the delay loop, interrupts are disabled, the line number is stored in the location specified by h_3, the line number is typed out if $h_4 \neq 0$, and exit is made to the next higher statement number.</p> <p>If no interrupt occurs while waiting in the delay loop, interrupts are disabled and exit is made to the statement number specified by NUM.</p> <p>Example:</p> <p>INT, FFFF, 100, (2000), F, 7.6 (cr)</p> <p>All interrupt lines are enabled by the mask.</p> <p>Routine will wait (256x100) about 25.6 milliseconds for interrupt.</p> <p>Line number will be stored in cell \$2000.</p> <p>Line number will be typed out ($h_4 \neq 0$).</p> <p>If no interrupt occurs, exit will be made to statement number 7.6.</p>

Table 2.1b. OLYMPY Module (28 Subroutines) (Continued)

EQUIPMENT: Mainframe, TTY

MNEMONIC AND CALL	OPERATION
<p>INT, h_1, h_2, h_3, h_4, NUM cr (Continued) (Indirect mode only)</p>	<p>NOTE: Interrupts are always left disabled on exit.</p> <p>If more than one interrupt is present when routine is entered, only the lowest numbered line will be recognized.</p> <p>Interrupting device is not acknowledged by this routine.</p>
<p>NUM CLSN cr</p>	<p><u>CLEAR STATEMENT NUMBER</u></p> <p>This statement permits deletion of a statement that has been entered. It may be used during INPUT or EDIT operations. Example:</p> <p>NUM = Number of statement to be deleted</p> <pre>1.0 MSG, TEST1 2.0 MSG, TEST2 2.0 CLSN</pre> <p>The deleted statement will neither appear on the listing nor be executed. The statement number deleted may be re-used for another statement. The NUM CLSN will not be listed.</p>
<p>LSFT, h_1, h_2, h_3 cr</p>	<p><u>LEFT SHIFT, END AROUND</u></p> <p>Where: h_1 = Location of the word to be shifted h_2 = Shift count h_3 = Location to store the result of the SHIFT instruction</p> <p>Example: LSFT, (2000), 4, (2000)</p> <p>If the contents of cell \$2000 is \$000F, the word is left shifted 4 places to the left end around, and the result (\$00F0) is placed back into cell \$2000. (Refer to Paragraph 2.3.1 for further information.)</p>

Table 2.1b. OLYMPY Module (28 Subroutines) (Continued)

EQUIPMENT: Mainframe, TTY

MNEMONIC AND CALL	OPERATION
<p>RSFT, h_1, h_2, h_3, (cr)</p>	<p><u>RIGHT SHIFT, SIGN EXTENDED</u></p> <p>Where: h_1 = Location of the word to be shifted h_2 = Shift count h_3 = Location to store the result of the SHIFT instruction.</p> <p>Example: RSFT, (2610), A, (2620)</p> <p>If the contents of cell \$2610 is \$1000, the word is shifted \$A places to the right, sign extended, END OFF, and the result (\$FFE0) is placed into cell \$2620. (Refer to Paragraph 2.3.1 for further information.)</p>

Table 2.1c. OLYMPUS 1742 Line Printer (OLDC42) Module (1 Subroutine)

PROGRAM NO. 88780800

CORE SIZE: \$C5

EQUIPMENT: Mainframe, TTY, 1742 Line Printer

MNEMONIC AND CALL	OPERATION
DPL, Start Core, End Core (cr)	<p><u>DUMP CORE ON 1742 LINE PRINTER</u></p> <p>The contents of the Core area (Start Core Absolute) to (End Core Absolute) are printed in hexadecimal form on the Line Printer. Lines whose words are the same as the last printed word are ignored by printing a row of asterisks.</p>
ELP, Equipment Code (cr)	<p><u>SET EQUIPMENT CODE</u></p> <p>This operation sets the equipment code in the software logic to the code selected by the hardware switch. Unless this entry is made the equipment code is assumed to be "4".</p>

Table 2.1d. OLYMPUS Mainframe (OLMANF) Module (12 Subroutines)

PROGRAM NO. 392669XX
EQUIPMENT: Mainframe, TTY

CORE SIZE: \$23F

MNEMONIC AND CALL	OPERATION
<p>LHX, Core Location, base (cr) Data*, Data*,, Data* (cr)</p>	<p><u>LOAD HEXADECIMAL INTO CORE</u></p> <p>This program allows the operator to load data into core. Loading starts at the location specified (core location + base) and continues at consecutive addresses until all the data is entered. Base is assumed to be zero if not entered. This OLYMPUS subprogram requires more than one line on the TTY to call. Any number of fields are allowable in the second (and subsequent) lines when using this call.</p> <div style="border: 1px solid black; width: fit-content; margin: 10px auto; padding: 2px 10px;">NOTE</div> <p>Data* may be:</p> <ol style="list-style-type: none"> a. A 4-digit hexadecimal number, e. g., 14EA. b. A one-word relative instruction: 2-digit OP code * 4-digit address, e. g., C8*1606, at core location P. This indicates that core location P is loaded with (C8hh where hh = 1606 - P). c. A one-word relative address: *Address, e. g., *1606 at location P with LHX, P as the subprogram. Core location P is loaded with hhhh, where hhhh = (1606 - P).
<p>ADH, h₁, h₂ (cr)</p>	<p><u>ADD HEXADECIMAL VALUES</u></p> <p>h₁ is added to h₂. The sum is typed out on the TTY in the form: hhhh.</p>
<p>SBH, h₁, h₂ (cr)</p>	<p><u>SUBTRACT HEXADECIMAL VALUES</u></p> <p>h₂ is subtracted from h₁. The difference is typed out on the TTY in the form: hhhh.</p>

Table 2.1d. OLYMPUS Mainframe (OLMANF) Module (12 Subroutines)(Continued)

EQUIPMENT: Mainframe, TTY

MNEMONIC AND CALL	OPERATION																																
P, Core Location, Q, A, M, I (cr)	<p><u>START EXECUTION AT P WITH Q-, A-, M-, AND I-REGISTERS SET TO THE SPECIFIED VALUES</u></p> <p>The operator exercises his option to reset the P-, Q-, A-, M-, and I-registers to any desired values before continuing the operation. Unspecified values will be set to zero.</p>																																
RSN, Core Location, Q, A, M, I (cr)	<p><u>RETURN JUMP TO SUBPROGRAM WITH REGISTERS SET AND A POST SNAP</u></p> <p>OLYMPUS causes a return jump to the routine. This occurs at the location specified in the call. The Q-, A-, M-, and I-registers are set to the values specified by the call.</p>																																
SCN, Start Core, End Core, Number 1, Mask, Increment (cr)	<p><u>SEARCH CORE FOR NUMBER</u></p> <p>The designated region of core is searched for the bits of words which contain those portions of Number 1 activated by the Mask. Activation is accomplished by a logical AND process. This allows the Mask to select from the Number 1 either a full word or any binary portion of it. "1s" in the Mask select portions of the word; "0s" in the Mask allow the "searched-for" word to have any values in those positions. The following examples demonstrate the process:</p> <p><u>Example 1</u></p> <table style="margin-left: auto; margin-right: auto;"> <tr> <td>Number 1</td> <td>=</td> <td>\$2A74</td> <td>=</td> <td>0010</td> <td>1010</td> <td>0111</td> <td>0100</td> </tr> <tr> <td>Mask</td> <td>=</td> <td>\$FF00</td> <td>=</td> <td>1111</td> <td>1111</td> <td>0000</td> <td>0000</td> </tr> <tr> <td>Search</td> <td>=</td> <td>\$2Ahh</td> <td>=</td> <td>0010</td> <td>1010</td> <td>xxxx</td> <td>xxxx</td> </tr> <tr> <td></td> <td></td> <td></td> <td></td> <td colspan="2" style="text-align: center;">} specified</td> <td colspan="2" style="text-align: center;">} unspecified</td> </tr> </table>	Number 1	=	\$2A74	=	0010	1010	0111	0100	Mask	=	\$FF00	=	1111	1111	0000	0000	Search	=	\$2Ahh	=	0010	1010	xxxx	xxxx					} specified		} unspecified	
Number 1	=	\$2A74	=	0010	1010	0111	0100																										
Mask	=	\$FF00	=	1111	1111	0000	0000																										
Search	=	\$2Ahh	=	0010	1010	xxxx	xxxx																										
				} specified		} unspecified

EQUIPMENT: Mainframe, 1711 TTY, 1721 PTR, 1723 PTP

MNEMONIC AND CALL	OPERATION
	<p>This module is identical to OL1712 but without statements RTP and PPT which drive the 1712 TTY. See Table 2.1e.</p>

Table 2.1g. OLYMPUS 1713 TTY (OL1713) Module (4 Subroutines)

PROGRAM NO. 392670XX

CORE SIZE: \$153

EQUIPMENT: Mainframe, 1713 TTY

MNEMONIC AND CALL	OPERATION
RPT, Core Location (cr)	<p><u>READ 1713 TELETYPEWRITER PAPER TAPE</u></p> <p>Mnemonic and call have same operation on 1713 TTY as on 1712. See Table 2.1d.</p>
PPP, Start Core, End Core (cr)	<p><u>PUNCH 1713 TELETYPEWRITER PAPER TAPE RECORD</u></p> <p>Mnemonic and call have same operation on the 1713 TTY as on the 1712. See Table 2.1d.</p>
VPR, Core Location (cr)	<p><u>VERIFY RECORD ON TAPE READER AGAINST CORE</u></p> <p>Mnemonic and call have the same operation on the 1713 tape reader as on the 1721 Paper Tape Reader. See Table 2.1d.</p>
OUT, Start Core, End Core (cr)	<p><u>OUTPUT ASCII ON TTY</u></p> <p>Mnemonic and call have the same operation on the 1713 TTY as on the 1711/12. See Table 2.1d.</p>

Table 2.1h. OLYMPUS 1728/430 Card Reader (OL8BIT) Module (4 Subroutines)

PROGRAM NO. 80880701

CORE SIZE: \$140

EQUIPMENT: Mainframe, 1711/1712 TTY, 1728/430 CR

MNEMONIC AND CALL	OPERATION
E8D, Equipment Number (cr)	<p><u>SET EQUIPMENT CODE</u></p> <p>This operation sets the equipment code in the software logic to the code selected by the hardware switch. Unless this entry is made the equipment code is assumed to be "\$A". This instruction must precede all other Card Reader instructions.</p>
R8D, Start Core (cr)	<p><u>READ CARDS FROM 1728/430 CARD READER</u> <u>8-BIT BINARY FORMAT</u></p> <p>The information stored on 8-bit binary cards that are loaded onto the 1728/430 are read into core starting at the location specified. See Note under "MBC". If a checksum error exists, the TTY prints out CHECKSUM ERROR.</p>
P8D, Start Core, End Core (cr)	<p><u>PUNCH CORE ON 1728/430 CARD READER IN</u> <u>8-BIT BINARY FORMAT</u></p> <p>The contents of that portion of core between (Start Core) and (End Core) is punched out in the 1728/430 in 8-bit binary format similar to paper tape.</p>
V8D, Start Core (cr)	<p><u>VERIFY 8-BIT BINARY CARDS IN THE 1728/430 AGAINST CORE</u></p> <p>The information on 8-bit binary cards is verified against information in core starting at (START CORE).</p> <p>Errors are printed out on the TTY in the form:</p> <p style="text-align: center;">VERIFY ERROR</p>

Table 2.1h. OLYMPUS 1728/430 Card Reader (OL8BIT) Module (4 Subroutines) (Continued)

EQUIPMENT: Mainframe, 1711, 1712 TTY, 1728/430 CR

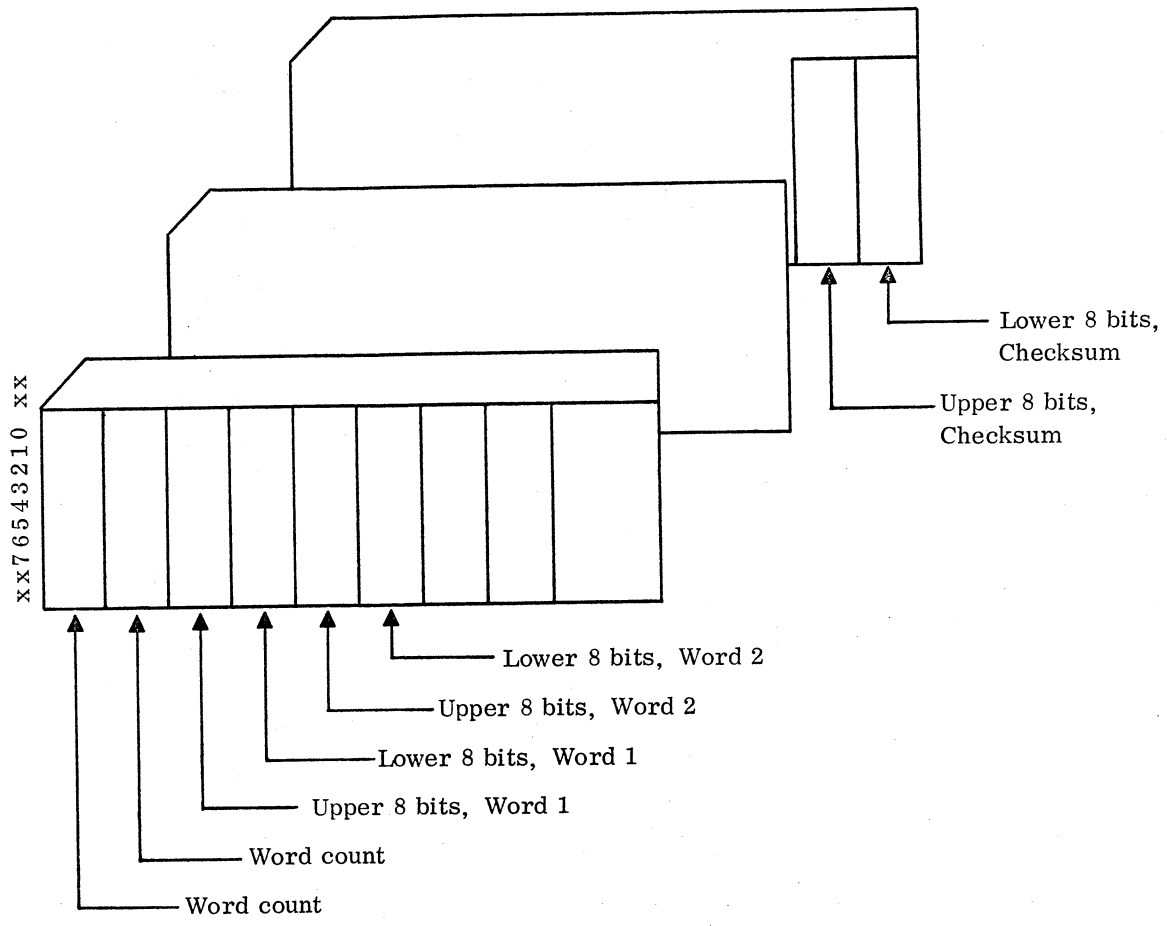

MNEMONIC AND CALL	OPERATION
V8D, Start Core (cr) (Continued)	<p>The data on 8-bit binary cards is in the format:</p>  <p>The diagram illustrates the data format on an 8-bit binary card. It shows a sequence of words, with the first two words explicitly labeled as Word 1 and Word 2. Each word is 16 bits long, divided into an upper 8-bit section and a lower 8-bit section. The lower 8 bits of each word contain the checksum for the upper 8 bits. The words are arranged in a staircase pattern, with Word 1 starting at bit position 1 and Word 2 starting at bit position 9. The bit positions are labeled on the left as xx76543210 xx. Labels with arrows indicate the 'Word count' for each word, the 'Upper 8 bits, Word 1', 'Lower 8 bits, Word 1', 'Upper 8 bits, Word 2', and 'Lower 8 bits, Word 2'. On the right, a separate box shows the 'Upper 8 bits, Checksum' and 'Lower 8 bits, Checksum' for the entire data block.</p>

Table 2.1j. OLYMPUS Drum (OLDR52) Module (3 Subroutines)

PROGRAM NO. 39759102

CORE SIZE: \$21E

EQUIPMENT: Mainframe, TTY, 1752 Drum

MNEMONIC AND CALL	OPERATION
	Refer to OLYMPUS Drum (OLDRUM) Module for operating instructions. Mnemonics and functions are identical to the 1751 Module.

Table 2.1k. OLYMPUS Reject Handling (OLYREJ) Module

PROGRAM NO. 849682XX
 EQUIPMENT: Mainframe, TTY

CORE SIZE: \$54

MNEMONIC AND CALL	OPERATION
RJTP, N (cr)	<p><u>SPECIFY REJECT OPTION</u></p> <p>Internal and external rejects may be handled by a common routine (see paragraph 2.6.2). This routine prints a comment containing information about the reject. This mnemonic allows user control of the comment printout by specifying N, where N may have the following values:</p> <p>N = 0, printout is bypassed</p> <p>N = m, printout is discontinued after m number of printouts if not re-initialized by this statement</p> <p>N = \$8000, printout always occurs</p>

Table 2.11. OLYMPUS Drum (OLDRUM) Module (3 Subroutines)

PROGRAM NO. 849951XX

CORE SIZE: \$11F

EQUIPMENT: Mainframe, TTY, 1751 Drum

MNEMONIC AND CALL	OPERATION
<p>RDM, Start Core, End Core, MSB Drum, LSB Drum (cr)</p>	<p><u>READ DRUM TO CORE</u></p> <p>Data is transferred from drum to core. The drum is addressed by a two-word hexadecimal address called Most Significant Bits of Drum Address and Least Significant Bits of Drum Address^⑩. Data loading in core starts at Start Core. Transfer terminates when End Core address is reached.</p>
<p>WDM, Start Core, End Core, MSB Drum, LSB Drum (cr)</p>	<p><u>WRITE CORE ON DRUM</u></p> <p>Data is transferred from core to drum. Core starting address is at Start Core; drum starting address is at MSB Drum, LSB Drum. Transfer terminates when word stored at End Core is transferred.</p>
<p>VDM, Start Core, End Core, MSB Drum, LSB Drum (cr)</p>	<p><u>VERIFY DRUM AGAINST CORE</u></p> <p>Data on drum starting at location MSB Drum, LSB Drum is compared to data in core starting at Start Core. The contents of the two storage regions are compared word by word through the End Core address. If errors occur, they are printed out on the TTY in the following format.</p>
<p>^⑩The drum is treated as a word addressable storage device. The MSB of the drum address selects a 32K block of storage. The LSB of the drum address selects a starting word within the 32K block. The maximum value of the LSB Drum address is \$7FFF. \$FFFF is illegal.</p>

Table 2.1t. OLYMPUS Digital Input (OLRDGI) Module

PROGRAM NO. 849971XX

CORE SIZE: \$195

EQUIPMENT: Mainframe, TTY, 1750 DCT, 1544

MNEMONIC AND CALL	OPERATION
<p>RDGI, h₁, h₂, A, h₄, h₅ (cr)</p>	<p><u>READ DIGITAL INPUT</u></p> <p>Where: h₁ = First digital input channel address</p> <p>h₂ = Last digital input channel address</p> <p>A = Starting core location for data storage</p> <p>h₄ = Store/Type/Compare h₄ = 0, Data is stored only</p> <p>h₄ = 1, Data is compared with previously stored data and any variation results in data being stored and printed</p> <p>h₄ ≥ 2, Data will be stored and typed</p> <p>h₅ = W-E-S code (equipment number of DCT)</p> <p>This statement reads, prints, stores, and compares digital inputs as specified. The Internal/External Reject Processor will be called if hardware rejects occur.</p> <p>All parameters must be entered once. Thereafter, only parameter h₁ must be entered. The statement uses previously entered values for h₂ through h₅ if these parameters are not entered.</p> <p>Hardware required is the 1544 Digital Input Interface or the 1547 Digital Events Counting Interface.</p> <p>Example:1:</p> <p>RDGI, 0, 1, 10, 2, 400 (cr)</p> <p>Digital input channel addresses of 0 and 1 will be stored in cells 10 and 11. A comment will be printed with the following format.</p>

Table 2.1t. OLYMPUS Digital Input (OLRDGI) Module (Continued)

EQUIPMENT: Mainframe, TTY, 1750 DCT, 1544

MNEMONIC AND CALL	OPERATION
<p>RDGI, h₁, h₂, h₃, h₄, h₅ (cr) (Continued)</p>	<p>DGI CHNL 0000 IS hhhh DGI CHNL 0001 IS hhhh</p> <p>Where hhhh is the value read in hexadecimal.</p> <p>Examples 2 and 3:</p> <p>(2) RDGI, 0, F, 10, 0, 400 (cr) (3) RDGI, 0, F, 10, 1 (cr)</p> <p>Example 2 causes digital input channels 0-F to be stored in cells 10 through 1F.</p> <p>Example 3 causes digital input channels 0-F to be read and compared with previously stored values. Any variations will cause the following comment to be printed:</p> <p style="text-align: center;">DGI CHNL CCCC IS h₁h₁h₁h₁ WAS h₂h₂h₂h₂</p> <p>Where: CCCC = Channel Address h₁h₁h₁h₁ = New Value h₂h₂h₂h₂ = Old Value</p> <p>Examples 4 and 5:</p> <p>(4) RDGI, 0, 0, 10, 2, 400 (cr) (5) RDGI, 2 (cr)</p> <p>Examples 4 and 5 illustrate the abbreviated format of the statement once the parameters have been initially loaded. Example 4 reads channel 0, Example 5 reads channel 2. Note that the statement always reads from h₁ through h₂. Thus, to insure only one channel is read, h₂ must be set less than h₁, i. e., zero. The comment for Example 5 is:</p> <p style="text-align: center;">DGI CHNL 0002 IS hhhh</p> <p>Where: hhhh = Hexadecimal Value.</p>

Table 2.1u. OLYMPUS Read Analog Converter (OLRADC) Module

PROGRAM NO. 849970XX

CORE SIZE: \$195

EQUIPMENT: Mainframe, TTY, 1750 DCT, 1530/34

MNEMONIC AND CALL	OPERATION
<p>RADC, $h_1, h_2, A, h_4, h_5, h_6, h_7, h_8$ (cr)</p>	<p><u>READ ANALOG CONVERTER</u></p> <p>Where: h_1 = First channel address</p> <p>h_2 = Last channel address</p> <p>A = Starting core location for data storage</p> <p>h_4 = Gain or speed (0 = lowest, 3 = highest)</p> <p>h_5 = Type/Store/Compare. $h_5 = 0$, Data is stored only $h_5 = 1$, Data will be stored and printed $h_5 \geq 2$, Data is compared to previously stored data and any variation $\geq h_5$ causes data to be stored and printed</p> <p>h_6 = W-E-S code (DCT equipment number and analog to digital converter (ADC) station address)</p> <p>h_7 = Positive full scale ADC count</p> <p>h_8 = Shorted input ADC count</p> <p>This statement is designed for use with 1530/34 A/D systems and will sequentially scan all analog inputs specified by parameters h_1 and h_2 at the gain/speed specified and type, store, or compare as specified by parameter h_5. The program uses parameters h_7 and h_8 to determine whether the ADC is a 210, 212, 214, or DADIT.</p> <p>Stored data is raw, unshifted data as read from the ADC.</p> <p>Typed data is in percent of full scale as follows.</p>

Table 2.1u. OLYMPUS Read Analog Converter (OLRADC) Module (Continued)

EQUIPMENT: Mainframe, TTY, 1750 DCT, 1530/34

MNEMONIC AND CALL	OPERATION
	<p>Sample Typeout:</p> <p style="text-align: center;">+</p> <p style="text-align: center;">CH 801=-000.15 %FS</p> <p style="text-align: center;">*</p> <p style="text-align: center;">↑</p> <p style="text-align: center;">Either +, -, or *. *Bad data bit set.</p> <p>Parameter h_1 must always be entered. Parameters h_2 through h_8 must be entered once. The program stores these as constants and they need not be reentered each time this statement is used. Any time a parameter is entered, all preceding parameters must be entered also.</p> <p>This statement requires the Internal/External Reject Processor.</p> <p>Example 1:</p> <p style="text-align: center;">RADC, 800, 80F, 1000, 3, 1, 456, 3F7A, 186A (cr)</p> <p>DADIT analog inputs 800 through 80F will be scanned at their highest speed, stored in cells 1000-100F, and typed out. The 3F7A and 186A specify a DADIT.</p> <p>Example 2:</p> <p>Once Example 1 has been executed, setting up the program's parameters, the following call may be used.</p> <p style="text-align: center;">RADC, 802 (cr)</p> <p><u>Results:</u> Same as Example 1 except inputs 802 through 80F are used.</p> <p>Examples 3 and 4:</p> <p style="text-align: center;">(3) RADC, 800, 830, 2000, 3, 0, 456, 3F7A, 186A (cr)</p> <p style="text-align: center;">(4) RADC, 800, 830, 2000, 3, 4 (cr)</p>

Table 2.1u. OLYMPUS Read Analog Converter (OLRADC) Module (Continued)

EQUIPMENT: Mainframe, TTY, 1750 DCT, 1530/34

MNEMONIC AND CALL	OPERATION
	<p>Example 3 reads DADIT inputs 800-830 at its highest rate of read and stores data into cell 2000 through 2030.</p> <p>Example 4 reads the same inputs and compares them with the values from Example 3. Any variation $\geq \pm 4$ counts causes the new value to be stored and printed.</p> <p>Examples 5 and 6:</p> <p>(5) RADC, 800, 0 (cr)</p> <p>(6) RADC, 80F (cr)</p> <p>Setting parameter $h_2=0$ insures that only one channel is read. Thus, Example 5 reads channel 800; Example 6 reads channel 80F. The data will be printed, stored, or compared, depending on the present value of parameter h_5.</p>

Table 2.1v. OLYMPUS Analog Input Histogram (OLHIST) Module

PROGRAM NO. 39226901

CORE SIZE \$3B1

EQUIPMENT: Mainframe, TTY, 1750 DCT, 1530/34

MNEMONIC AND CALL	OPERATION																				
<p>HIST, $h_1, h_2, h_3, h_4, h_5, h_6, h_7, h_8$ (cr)</p>	<p>Where: h_1 = First channel address</p> <p>h_2 = Last channel address</p> <p>h_3 = Number of passes. If bit 15 is set, the histogram printout is deleted.</p> <p>h_4 = Gain - This is a packed parameter word. The gain of each of the eight channels is set by two bits in the word. The most significant two bits refer to the first channel.</p> <p>Example: $h_4 = AAFF$</p> <table data-bbox="695 1056 1052 1329"> <tr> <td>Channel = 0</td> <td>Gain = 2</td> </tr> <tr> <td>1</td> <td>2</td> </tr> <tr> <td>2</td> <td>2</td> </tr> <tr> <td>3</td> <td>2</td> </tr> <tr> <td>4</td> <td>3</td> </tr> <tr> <td>5</td> <td>3</td> </tr> <tr> <td>6</td> <td>3</td> </tr> <tr> <td>7</td> <td>3</td> </tr> </table> <p>h_5 = Scale Factor - The deviation in counts from the average is divided by this number prior to collecting in the histogram. If bit 15 is set, values outside the histogram span are typed out as errors.</p> <p>h_6 = W-E-S code. Example: 0456</p> <p>h_7 = ADC counts for 100% FS input</p> <p>Example:</p> <table data-bbox="695 1745 911 1808"> <tr> <td>212</td> <td>7CF</td> </tr> <tr> <td>214</td> <td>1FFF</td> </tr> </table> <p>h_8 = ADC counts for 0% FS</p>	Channel = 0	Gain = 2	1	2	2	2	3	2	4	3	5	3	6	3	7	3	212	7CF	214	1FFF

-4	0000	0000	0000	0000	0000	0000	0000	0000	0000
<u>Program Function</u>									
<p>OLHIST, when entered with the appropriate parameters from the executive OLYMPUS, first reads all selected analog input channels 16 times, calculates the average for each eighth channel, stores the average, and prints out the average in terms of decimal percent of full scale. The subroutine, if selected, then reads all selected channels the requested number of times comparing the reading each time to the average reading. The deviation is scaled by the "Scale Factor" parameter, and the summary results are output as the Histogram. If the error typeout option has been selected, all channels which fall outside the histogram after scaling (i.e., greater than ± 4 counts from the average) are typed out with the error in hex counts.</p>									
<p>The subroutine allows the gain of each eighth channel to be specified by an input parameter.</p>									

Table 2.1w. OLYMPUS Relay DAC Output (OLRDAC) Module

PROGRAM NO. 88776000

+25% = 16_{16}	Full Scale												
+0% = 0_{16}	Full Scale												
-25% = $FFE9_{16}$	Not available on a 1560 DAC Module												
-50% = $FFCD_{16}$													
-100% = $FF9B_{16}$													

Table 2.1w. OLYMPUS Relay DAC Output (OLRDAC) Module (Continued)

EQUIPMENT: Mainframe, TTY, 1750 DCT, 1558, 1560

MNEMONIC AND CALL	OPERATION
	<p>digital value and then increments it by 1 until Full Scale is reached. When Full Scale has been output the DAC output is again zeroed. The ramp frequency is determined by the delay parameter and can be selected to get a clear presentation on the device used to monitor the ramp.</p> <p>The test uses the interrupt line from the 1558 and has a comprehensive list of error checks and messages. These are:</p> <ul style="list-style-type: none"> A. Parameter Input Errors B. Internal/External Interrupts C. Lost Interrupts D. Select Errors E. Status Checks F. Interrupt Disabled Errors <p>At the completion of the ramp test the program can be exited by momentarily setting the Skip switch on the mainframe console. The program can be used in an indirect program list to scan all channels if more than one is to be tested.</p> <p>The DAC Output requires an external piece of test equipment in order to monitor the voltage waveforms or simply a current meter. Caution should be used in setting up the output monitor so as not to create errors in the impedance loop used by the DAC. Many tests can be run using the customers equipment such as a trend recorder or set point station.</p> <p>Example 1:</p> <p style="padding-left: 40px;">Calibrate Test: RDAC, 85, 0, 32, 0, C, 458, (LF)(cr)</p> <p>DAC channel address 85 on DET, equipment number 8, station address 58 will now output 50% of Full Scale and wait for a 1558 interrupt on line 12. If no interrupt occurs within ≈ 100 microseconds an error message is printed. If the interrupt does not occur, the test outputs a message — "Calibration output complete. Check DAC board output".</p>

Table 2.1w. OLYMPUS Relay DAC Output (OLRDAC) Module (Continued)

EQUIPMENT: Mainframe, TTY, 1750 DCT, 1558, 1560

MNEMONIC AND CALL	OPERATION
	<p>Example 2:</p> <p>Ramp Test: RDAC, 81, 1, 0, 100, 5, 458, (LF) (cr)</p> <p>DAC channel address 81 on DCT equipment number 8 station 58 will now output a ramp signal. A message will be printed on the TTY "Ramp test. Observe wave form at DAC board." After each output to the 1558 an interrupt occurs and is processed. Frequency of the ramp signal is determined by h_4. In this case, a delay of 10 milliseconds between outputs will occur. The interrupt is expected on line 5. h_3 has now meaning in this test. Momentarily hit the Skip switch to exit test.</p>

MDC optional; 1534 or 1538 or 1536, 1742 optional

MNEMONIC AND CALL	OPERATION
GHST, $h_1, h_2, h_3, h_4, h_5, h_6, h_7, h_8$ (cr) (continued)	<p>h_4 = Location to store back address of average value table - table is 8 locations long.</p> <p>h_5 = Analog Controller Function Word 1534 use \$0010 1538 use \$151D 1536 use \$0</p> <p>$h_6$ = Interrupt line in hex $h_6=0$ for I/O Mode 0</p> <p>h_7 = W-E-S Code for Channel Interface $h_7=0$ for I/O Modes 0, 2 $h_7=\\$460$ for I/O Mode 1</p> <p>h_8 = W-E-S Code for Analog Controller 1750 or MDC Equip Code = \$8 $h_8=\\$44E$ for 1538 or 1536 $h_8=\\$456$ for 1534</p> <p>After once entering all parameters the program may be recalled by entering only GHST, h_1 (cr). Provided that the average value table is not required to be referenced through parameter h_4.</p> <p><u>PROGRAM DESCRIPTION</u></p> <p>This module is a general purpose histogram and limit check routine useable with the 1534, 1538, or 1536 Analog Input Controller. It allows these controllers to operate as follows:</p> <p>A. I/O MODE 0</p> <ol style="list-style-type: none"> 1. 1534, 1538, or 1536 connected direct to 1750. 2. 1534, 1538, or 1536 connected through the 1797/1571 or MDC but operated in direct A/Q mode.

Table 2.1y. OLYMPUS General Purpose Analog Input Histogram Module (OLGHST) (Continued)

PROGRAM NO. 39548101

CORE SIZE: \$5EC

EQUIPMENT: Mainframe, TTY, 1750; 1797/1571 optional;

MDC optional; 1534 or 1538 or 1536, 1742 optional

MNEMONIC AND CALL	OPERATION
<p>GHST, $h_1, h_2, h_3, h_4, h_5, h_6, h_7, h_8$ (cr) (continued)</p>	<p>B. I/O MODE 1</p> <ol style="list-style-type: none"> 1. 1534, 1538, or 1536 operated in buffered mode (DSA) through the 1797/1571 <p>C. I/O MODE 2</p> <ol style="list-style-type: none"> 1. 1536 operated in buffered mode (DSA) through the MDC. <p>I/O Mode 0 operates as fast as the analog controller will operate but not more than about 25 KHz. Control is by "busy".</p> <p>I/O Mode 1 operates as fast as the analog controller will operate up to the limit of about 400 KHz (DSA limitation).</p> <p>I/O Mode 2 operates at 50 KHz.</p> <p>Data collection is done in burst mode for any I/O Mode. A total of ten channels are read for each burst and from these readings 8 data values are extracted and processed according to the Data Mode specified (parameter B in h_2).</p> <p>Parameter h_1 specifies the first channel address of a block of 8 channels which will be processed for a given call. If bit 15 is set a delay is engaged which limits the maximum sample rate on any one channel to 6 conversions per second.</p> <p>Setting bit 15 also adds \$400 to the channel address to put it in proper form for the 1534.</p> <p>Setting bit 14 transfers the histogram output from the TTY to the 1742 Line Printer. Note: LPRNT3 must be linked in OLYMPUS.</p> <p>Parameter h_2 is a packed parameter which specifies the print mode, limit test interval, Data Mode, and number of passes.</p> <p>The limit test which may be used alone or with a histogram print out automatically determines if all channels pass a 3σ limit with the interval specified by L in h_2. If L is specified by 2 for example a particular channel will be good if 99.7% of the readings are contained between +2</p>

MNEMONIC AND CALL	OPERATION																						
<p>GHST, $h_1, h_2, h_3, h_4, h_5, h_6, h_7, h_8$ (cr) (continued)</p>	<p>and-2 ADC counts from the mean value. If more than 0.3% of the readings are outside these limits the channel number and the total number of out-of-limit readings will be printed. The limit test is useful for large subsystems to reduce the print out time or for a go-no go test.</p> <p>The Data Mode parameter B in h_2 specifies the method of processing the ten readings taken for each burst of data collection. Depending upon the configuration of the controller and the method of interfacing to the computer the channel data may correspond to the channel address, be one behind the channel address, or be two behind the channel address. The Data Mode parameter is simply an index to the collected data specifying the location of the data for the first channel.</p> <p>Example for 1536</p> <table border="0" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th style="text-align: left;"><u>Executed Channel Address</u></th> <th style="text-align: right;"><u>Data</u></th> </tr> </thead> <tbody> <tr> <td>0</td> <td style="text-align: right;">X</td> </tr> <tr> <td>1</td> <td style="text-align: right;">X</td> </tr> <tr> <td>2</td> <td style="text-align: right;">0</td> </tr> <tr> <td>3</td> <td style="text-align: right;">1</td> </tr> <tr> <td>4</td> <td style="text-align: right;">2</td> </tr> <tr> <td>5</td> <td style="text-align: right;">3</td> </tr> <tr> <td>6</td> <td style="text-align: right;">4</td> </tr> <tr> <td>7</td> <td style="text-align: right;">5</td> </tr> <tr> <td>0</td> <td style="text-align: right;">6</td> </tr> <tr> <td>1</td> <td style="text-align: right;">7</td> </tr> </tbody> </table> <p style="margin-left: 100px;">DATA IS 2 BEHIND</p> <p style="margin-left: 300px;">← B = 2</p>	<u>Executed Channel Address</u>	<u>Data</u>	0	X	1	X	2	0	3	1	4	2	5	3	6	4	7	5	0	6	1	7

PROGRAM NO. 39548101

CORE SIZE: \$5EC

EQUIPMENT: Mainframe, TTY, 1750; 1797/1571 optional;
MDC optional; 1534 or 1538 or 1536, 1742 optional

MNEMONIC AND CALL	OPERATION
GHST, $h_1, h_2, h_3, h_4, h_5, h_6, h_7, h_8$ (cr) (continued)	<p>Parameter h_3 specifies the type of converter, I/O Mode, and histogram scale factor.</p> <p>C of h_3 permits the program to normalize all data to ADC units.</p> <p>The histogram scale factor SS allows the user to compress the histogram if desired. Normally this parameter is entered as \$1, however, to troubleshoot channels having excessive noise this parameter may be increased in order to contain all readings within the histogram limits. SS parameter affects <u>only</u> the histogram scale.</p> <p>Parameter h_4 gives the user the means to find the table of average values for the 8 channels processed. This parameter is typically entered as a labeled storage location (i. e., G, H, etc.). After the program has executed the location specified by this parameter will contain the address of the first channel average. This mechanism may be used together with the no-print option to enable the user to read only the average value of each channel. These averages may be converted to percent full scale by the TYPD call.</p> <p>Parameters h_5 through h_8 are related to configuration, equipment codes, and interrupt assignments. Although values are listed for these parameters they are typical only and may vary system to system.</p> <p>The program operates to first read eight channels (starting with the channel number specified in h_1) the number of times specified in h_2. From this data an average value is calculated and stored for each channel. This average value is used as the reference value for construction of the histogram.</p> <p>Next the program reads each of the eight channels again the number of times specified in h_2. Each data value obtained is compared to the appropriate average and the deviation in ADC units is calculated. Based on the deviation and the scale factor the appropriate histogram bin is incremented.</p>

Type a (cr) to continue. The loader will initialize back to the start of the last input program. To abort the loading, type "F (cr)."</p>

2.6
 GENERATING NEW
 OLYMPUS ROUTINES

The following rules and interface specifications are given as information to the user who wishes to write his own special statement processors to be loaded and operated under the OLYMPUS executive.

OPERATION	PROCEDURE
<p>2.6.1 WRITE PROGRAM CON- FORMING TO OLYMPUS REQUIREMENTS</p>	<ol style="list-style-type: none"> 1. Write a subprogram that will perform the desired function. The routine will be entered by a return jump. Exit must be to caller location plus one or two, depending on whether the statement was executed or not, respectively. 2. On entry to the processor, the Q-register contains the address of the address table and the I-register contains the address minus one of the value table. Only the address table should be referenced by OLYMPUS modules. The parameters may be picked up using the following operations: <pre style="margin-left: 40px;"> ADQ =N\$8000 STQ- I LDA- (I) STA* PARAMI RAO- I LDA- (I) STA* PARAMZ etc.</pre> 3. The mnemonic for each statement must be defined in a table at the beginning of the module. The table contains a three-word entry per mnemonic. Two words contain the mnemonic in ASCII, two characters per word. Spaces should precede a mnemonic with less than four characters. The third word contains a relative increment to the entry point of the processor. The last entry in the table must be a relative increment which threads the table to the table in the next module. This entry has the following format: <pre style="margin-left: 40px;"> ADC (END -*)</pre> <p>Where END is defined as the last location in the module + 1. This procedure is accomplished by placing an equivalence card as the last card of the module in the following format:</p> <pre style="margin-left: 40px;"> EQU END (*)</pre> <div style="text-align: center; border: 1px solid black; width: fit-content; margin: 10px auto; padding: 2px 10px;">NOTE</div> <p style="text-align: center;">Adding processors using NUM as a parameter requires modifications in the program OLYMPY.</p>

OPERATION	PROCEDURE
	<p>SAMPLE MODULE</p> <p>A module containing one statement processor, the add processor, would be coded as follows:</p> <pre> NAM ADD ALF 2, ADD ADD STATEMENT MNEMONIC ENTRY ADC ADD-* IN MNEMONIC TABLE ADC (END-*) LINK TO MNEMONIC TABLE IN NEXT MODULE * ADD STATEMENT PROCESSOR ADD NOP O ADQ* BIT#15 STQ- I LDA- (I) RAO- I ADD- (I) RAO- I STA- (I) JMP* (ADD) BIT #15 NUM \$8000 EQU END(*) END </pre>
<p>2.6.2 OLYMPUS INTERFACE ROUTINES</p> <p>Several OLYMPUS routines are available for use by user processors.</p>	<p>The interfaces with other OLYMPUS modules shall consist of the following routines only:</p> <p>UEXASC, PRINT, READCH, SNAP, INTREJ, EXTREJ, BINASC</p> <p>UEXASC - Hexadecimal to ASCII conversion. Converts a hexadecimal number to four ASCII characters formatted one character per word. The hexadecimal number is passed in the A-register. Q and I are not affected. The location of the four words to be filled are defined for the absolute and relative cases as follows.</p>

OPERATION	PROCEDURE										
	<p>Calling Sequence:</p> <pre> Abs. RTJ UEXASC ADC LIST Rel. RTJ UEXASC ADC (LIST-*) </pre> <p>Return is made to call + 2.</p> <p>Example:</p> <pre> NUM = \$1234 </pre> <p>The calling sequence is:</p> <pre> LDA NUM RTJ UEXASC ADC BUFFER Next Instruction </pre> <p>The number \$1234 will be converted to:</p> <table border="1" data-bbox="568 1155 941 1365"> <thead> <tr> <th><u>Location</u></th> <th><u>Contents</u></th> </tr> </thead> <tbody> <tr> <td>BUFFER + 0</td> <td>0031</td> </tr> <tr> <td>BUFFER + 1</td> <td>0032</td> </tr> <tr> <td>BUFFER + 2</td> <td>0033</td> </tr> <tr> <td>BUFFER + 3</td> <td>0034</td> </tr> </tbody> </table> <p>This format is acceptable for printout since "0's" are ignored.</p> <p>PRINT or PRINTE</p> <p>Prints on the TTY ASCII characters from a list formatted two ASCII characters per word. The end-of-text character (\$03) must be the terminating character in the list. The calling sequence is defined for the absolute and relative cases as follows:</p> <p>PRINT returns with interrupts inhibited. PRINTE returns with interrupts enabled. Q & I not affected.</p>	<u>Location</u>	<u>Contents</u>	BUFFER + 0	0031	BUFFER + 1	0032	BUFFER + 2	0033	BUFFER + 3	0034

OPERATION	PROCEDURE
	<p>Calling Sequence:</p> <pre> Abs. RTJ PRINT ADC LIST Rel. RTJ PRINT ADC (LIST-*) </pre> <p>Example:</p> <pre> RTJ PRINT ADC (MESSAG-*) Next Instruction </pre> <p>MESSAG ALF 5, UNIT 2 OFF</p> <p>NUM \$0D 0A, \$0300 LF, (cr), end</p> <p>The message output is:</p> <pre> UNIT 2 OFF LPRNT3 </pre> <p>Prints on the 1742 Line Printer ASCII characters from a list formatted two ASCII characters per word. The end-of-text character (\$03) must be defined for the absolute and relative cases as follows:</p> <p>Calling Sequence:</p> <pre> Abs. RTJ LPRNT3 ADC LIST Rel. RTJ LPRNT3 ADC (LIST-*) </pre> <p>Example:</p> <pre> RTJ LPRNT3 ADC (MESSAG-*) </pre> <p>MESSAG ALF 8, PRINTED MESSAGE</p> <p>NUM \$0D 0A, \$0300</p>

OPERATION	PROCEDURE
REJECT HANDLING	<p>The message output is:</p> <p style="text-align: center;">PRINTED MESSAGE (LF) (CR)</p> <p>The call requires the addition of OLYMPUS module "LPRNT3".</p> <p>The module also provides the operator with a call to the module as follows:</p> <p>LEQ, EQUIPMENT CODE: <u>Set Equipment Code</u></p> <p style="padding-left: 100px;">This operation sets the 1742 equipment code in the software logic to the code selected by the hardware switch. Unless this entry is made, the equipment code is assumed to be "\$4".</p> <p>READCH</p> <p>Read one character from the TTY or input buffer. The character is returned in the A-register. The calling sequence is:</p> <p style="text-align: center;">RTJ READCH</p> <p>The return is to call + 1. In the Direct mode of operation the character is read from the TTY; in the Indirect mode the character is read from the input buffer. In this case, the user must specify to the READCH subroutine the location in the input buffer where the characters are to be found.</p> <p>INTREJ and EXTREJ</p> <p>Link the user's module to the common reject handling routine. The routines output a comment containing information about the reject. The comment may be bypassed, printed a specified number of times, or always printed, depending on a parameter specified to the routine used. The parameter is specified via a statement as follows:</p> <p style="text-align: center;">RJTP, n (cr)</p>

OPERATION	PROCEDURE
	<p>where n may have the following values:</p> <p>n = 0, printout is bypassed</p> <p>n = m, printout is discontinued after m number of printouts if not reinitialized by this statement</p> <p>n = \$8000, printout always occurs</p> <p>The format of the comment is as follows:</p> <p>For internal rejects:</p> <p style="padding-left: 40px;">IN REJ Q=(q) X=(x) P=(p)</p> <p>For external rejects:</p> <p style="padding-left: 40px;">EX REJ Q=(q) X=(x) P=(p)</p> <p>Where q = contents of the Q-register x = input/output instruction p = absolute core location containing instruction</p> <p>The routine has two entry points, one for internal and the other for external rejects. Coding of input and output commands must be done in the following manner for the routine to obtain the required information for printout.</p> <p>Input coding sequence:</p> <pre> INP 2 JMP * *+7 JMP * *+3 RTJ EXTREJ RTJ INTREJ JMP * REJXIT (program continues here) </pre>

OPERATION	PROCEDURE
	<p>Where EXTREJ and INTERJ are entry points to the reject handling routine and must be defined as externals. All registers are restored on exit from these two routines.</p> <p>REJXIT is an entry point in callers routine to handle rejects properly.</p> <p>Note that if no reject handling is required by caller; i.e., rejects are to be ignored, the coding can be done as follows:</p> <pre> INP 2 JMP * *+6 JMP * *+3 RTJ EXTREJ RTJ INTREJ (program continues here) </pre> <p>No change in the format is permitted since the reject handler uses position to determine where the I/O instruction is.</p> <p>SNAP or SNAPE</p> <p>The contents of the P-, Q-, A-, and I-registers are typed out on the TTY whenever a SNAP is called. SNAPS are inserted in the user's program during assembly or may be patched-in using the OLYMPUS LHX routine (see Table 2.1c). The SNAP Call returns with interrupts inhibited; the SNAPE Call returns with interrupts enabled. The calling format is a return jump. No parameters are passed.</p> <p>Example:</p> <pre> RTJ SNAPE </pre> <p>The output on the TTY has the form:</p> <pre> P = hhhh, Q = hhhh, A = hhhh, I = hhhh </pre>

Appendix C

USEFUL OLYMPUS LANGUAGE PROGRAMS

This section contains equipment diagnostics developed by various users and written in OLYMPUS language.

The following programs are intended as skeleton diagnostics. They do not check all functions, only major ones. They provide a starting place to check out 1500 products.

Cables, address jumpers and interrupt lines are assumed to be per 1700 A/D Systems Recommended Equipment Codes, etc. (39005300).

1572 Sample Rate Generator

This test has three parts:

Test 1 is in the Elapsed Time mode. The 1572 is cleared, and enabled. The counter status is read and tracked by parameter H. Error typeout occurs if the counter skips or counts too fast. (The oscillator pickoff should be jumpered at a low rate on the PA card.) When the count reaches I, the test ends.

H = Internal program counter (usually start at 1).

I = Highest counter desired before exiting.

K = Status G = Status-1

Test 2 is similar, but the count is not checked. Test 2 is in the Sample Rate mode. When the count reaches G, an interrupt is generated and acknowledged. (Interrupt 11)(B) is expected.)

Test 3 creates a test loop for observing the sample rate generator sync pulse output.

NOTE

The following diagnostic test routine printout represents the Teletype output for each routine. Underscored comments are program documentation, not user input.

1572 Sample
Rate Generator

1573 Line Sync Generator

This test has two parts:

Part one reads and types DCT status, then enters a loop enabling and disabling the 1573 from the sync 1 line in the DCT. The sync 1 driver in the DCT (T. P. 23, card 20) may be monitored.

Part two enables the line sync interrupt, accepts it, types it, acknowledges it, and repeats in a loop.

Part 1 H = 6000
 K = 9000

Part 2 H = 9000

The line sync should be set up per the manual procedure.

1577 Stall Alarm Test

This test repeatedly clears the 1577 after a desired time period.

When the period is short enough, no alarm occurs. When the time is too long, the alarm sounds.

X = Time number

An X of 275 results in about a 100 ms period. Numbers larger than this result in alarms.

The alarm must be reset manually.

1577 Stall
Alarm Test

1544/1553 Compare Test

This test outputs a data pattern to 1553 channels and reads the complements back through the 1544. The output and input are compared ($H+S = 0$) and a timeout occurs on errors.

Eight channels are tested (as written).

The data is incremented by one after each pass through the channels. A two-word pass counter (P and Q) allows FFFF FFFF passes (many hours).

Setting the Skip switch exits the program.

The test is useful for long runs while performing margin, temperature or transient tests.

H = Start of data (usually 0)

J = 9000 (starting channel, test 0-7)

J = 9008 (starting channel, test 8-F)

There is no timeout suppression, so repeated errors will produce much Teletype paper.

1547 Event Counter

Channel 0 of 1553 is used to increment each counter. The counter is checked after each count and timeout occurs with any error. The counter is preset to all 1's and checked, then preset to all 0's and checked.

Variable

T = 0000	Preset all 0's.
U = 00FF	Preset all 1's.
V = 0400	DCT station (connect) address.
W = 545F or 1	Clear everything function to DCT.
X = 9000	1553 channel 0 address.
Y = 9200	1547 counter 0 address.
Z = 00FF	End-of-count.
G = Counter status	
H = Program counter	

Channel 0 of 1553 (J1) must be cabled to input of 1547 (J1). Cable must be moved to check counters other than counter 0.

The counter address, total count, and presets are variables.

Interrupt on end-of-count is not checked with this test.

1549 Interrupt Expander

This test uses the 1553 (Digital Output) to cause interrupts to the 1549. The Mask register in the 1549 is loaded for each interrupt. The complement of the mask is loaded into the 1553 and causes an interrupt to occur in that position in the 1549. (The complement is used because of the inverting by the signal conditioners.)

16 Interrupts are generated from channel 0 of the 1553, and connected to each group in turn by moving the cable and repeating the test.

	1553		1549	Mask Station G	Acknowledge Station H
(16 Interrupts)	J1	<u>Cable</u> →	-J1	414	410
			-J2	415	411
			-J3	416	412
			-J4	417	413

Move Card 34 → 35 To get from "Form C" inputs to "Ready-
37 → 38 Resume" logic level inputs.

Interrupt jumper: slot 8 pin 9 to slot 9 pin 7 (Interrupt 12). Group 1 all 16 bussed together slot 8.

1583 I/O Typewriter

This test is an "echo" test. One types a character, and the program immediately types it back.

Executing the test, the program turns on the typewriter and unlocks the keyboard.

The Computer-Manual switch on the typer box must be in computer position.

"Non-echo" characters are upper and lower case; red and black ribbon, etc. See manual for codes. These may be done by Direct OLYMPUS commands:

RITE, 430, 46, 400 (red ribbon)

All echo characters may now be done in red, upon re-executing the program. (On our Selectrics, upper and lower case are the same type.)

Machine functions (Keyboard Lock, Power On/Off) may also be done by Direct OLYMPUS commands:

RITE, 431, 25, 400 (power off)
G = Interrupt line (6)
S = Status
K = Character code
T = Test (for busy loop)

Address is for typer one.

1583 I/O Typewriter

EXERCISE - DC115B, FR102C, 1544, 1553

Information

Description

This OLYMPUS program operates in the Indirect mode. The operator types in two parameters upon request by the program. If buffered operation is requested, the FR102C is directed to a buffer(s) located in core loaded previously by the operator. Two input instructions follow the output: one for status and one for NMA. Printout occurs for each if the Skip switch is down. The data buffer for buffered-read instructions must be examined by exiting the program.

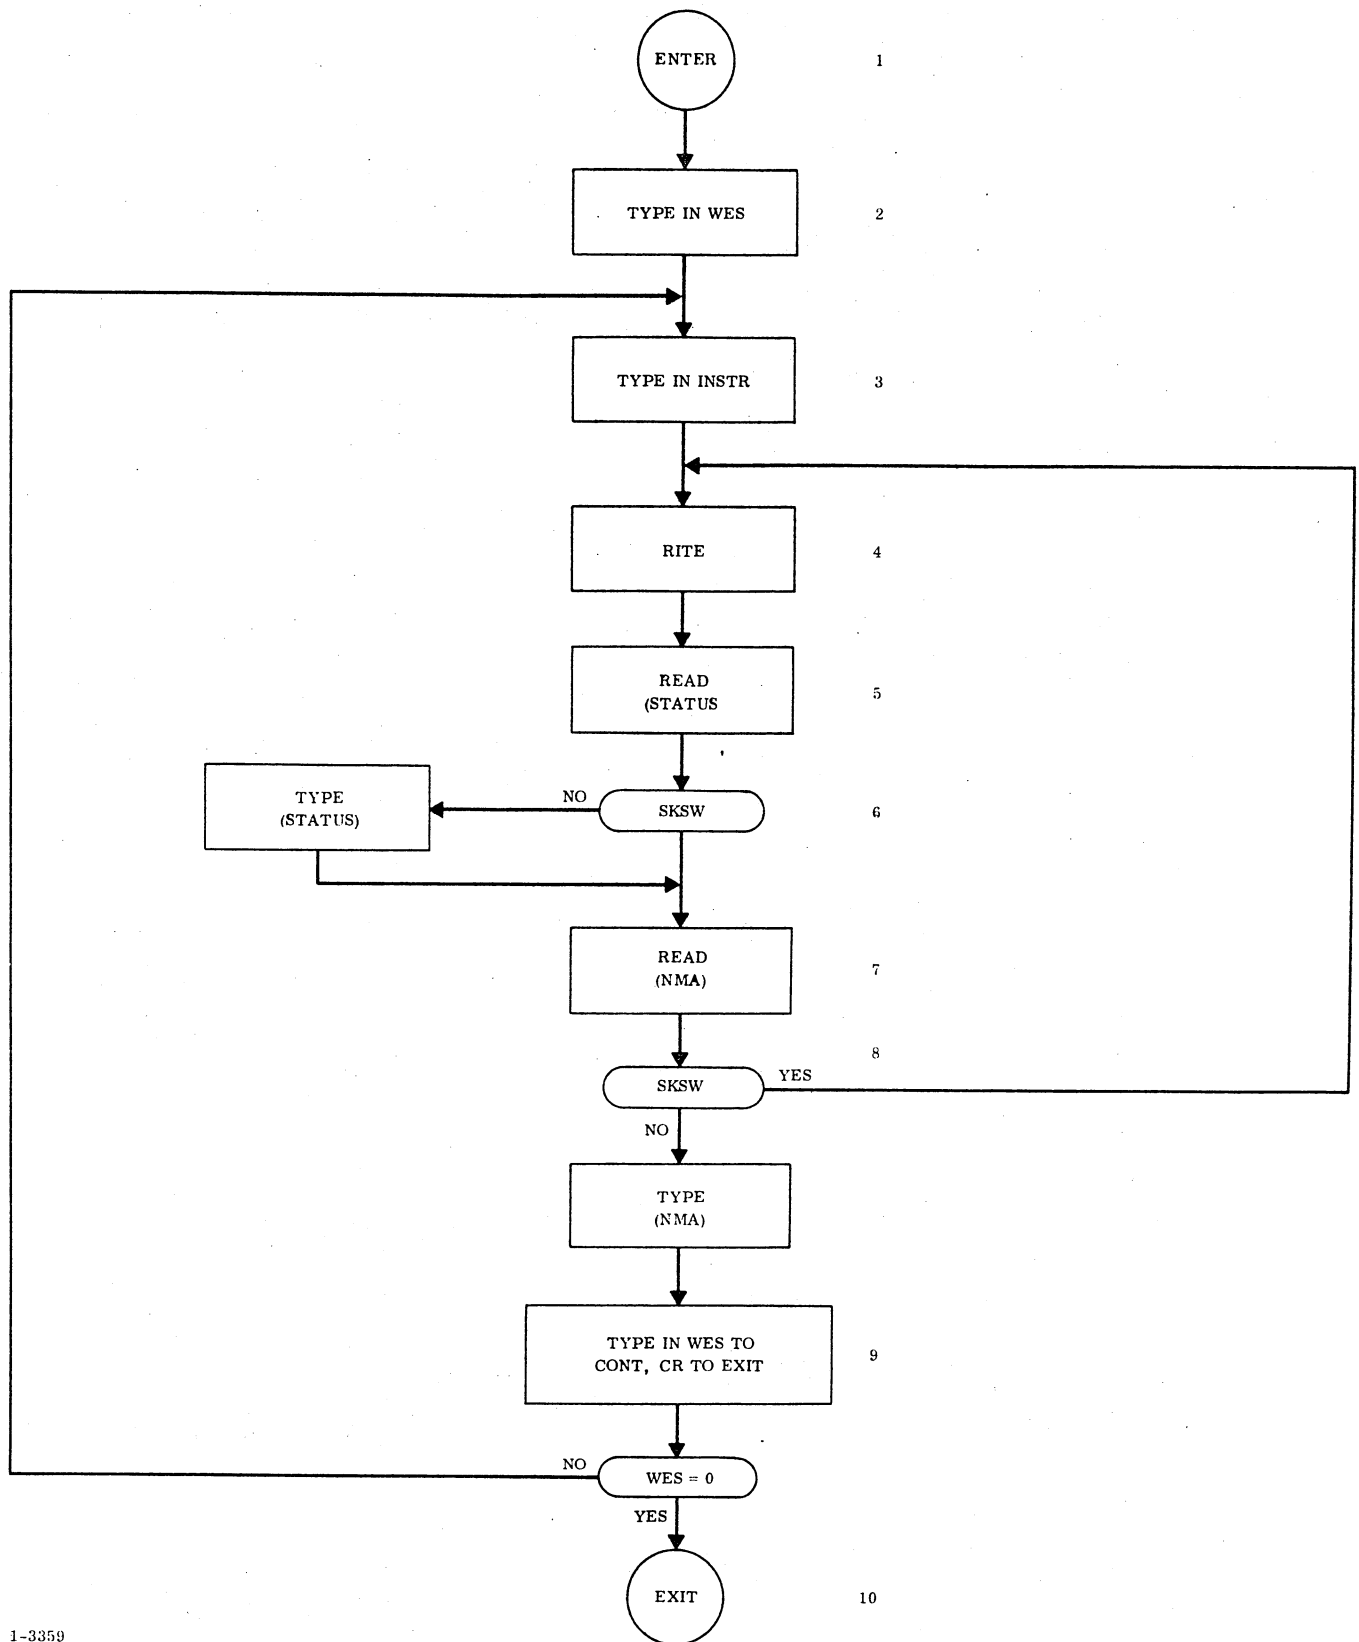

Program length 400₁₆ (Figure C1.)

Instructions

1. Load Buffer(s) where desired in core, 13₁₀ words each.
 - a. For basic buffer see page C.20.
 - b. For modification to basic buffer see page C.21.
2. Execute program from beginning (EXEC, 1.0).
 - a. For W & I entries see pages C.21-C.23.
 - b. For definition of status bits and NMA see page C.23.
 - c. To exit program to check buffer(s), enter (cr) when asked for value of W by typewriter (Skip switch must be down).

PROGRAM

1.0 MSG, EXERCISE - DC115B, FR102C, 1544, 1553

BASIC BUFFER (Output and Terminate)

<u>Core Location</u>	<u>Contents</u>	<u>Description</u>
FWA	8255	Output and Disable Terminate and Interrupt
FWA+1	E000	First and next Ch. = 0
FWA+2	9008	Last Ch. +1 = 8
FWA+3	(LMA)	*Last memory address (FWA+B)
FWA+4	(Ch. 0)	Data
FWA+5	(Ch. 1)	Data
FWA+6	(Ch. 2)	Data
FWA+7	(Ch. 3)	Data
FWA+8	(Ch. 4)	Data
FWA+9	(Ch. 5)	Data
FWA+A	(Ch. 6)	Data
FWA+B*	(Ch. 7)	Data
FWA+C	8000	Terminate

MODIFICATIONS TO BASIC BUFFER

<u>Mod</u>	<u>Core Location</u>	<u>Contents</u>
1. Input and terminate	FWA	8155
2. Chain	FWA+C	(New FWA)
3. Enable T on EOS (terminate End of Sequence)	FWA	8256
4. Enable NT on EOS	FWA	8259
5. Enable NT on EOB (End of Block)	FWA	8265
6. Enable NT on EOP (End of operation).	FWA	8295
7. Reset Ch. Address control	FWA	8455

BASIC INSTRUCTIONS

1. Output instruction to start buffered operation

RITE, W, I

W = WES (Execute 460-465)

I = FWA (first-word address of memory block)

2. Input instruction to check status

READ, W, I

W = WES (Execute 460-465)

I = core location to store status

3. Input instruction to check NMA (next memory address)

READ, W, I

W = WES (Execute 468-46D)

I = core location to store NMA

*These two instructions are contained in program and require no entries from operator.

W = WES (Execute 468-46D)

*11. Input instruction to check Next Channel Address

READ, S, I, W

S: Same as above (bits 10-15 only required)

I = Core location for NCA to be stored

W = WES (Execute 468-46D)

FR102C (1571B) STATUS

<u>Bit</u>	<u>Definition</u>
0	Ready
1	Busy
2	EOS
3	EOB
4	EOP
8	Protect Fault
9	Output Mode
10	True, if no 1572

FR102C (1571B) NMA

Bits 0-15	Next core location to be accessed.
Bit 16	If 0, bits 0-15 OK
	If 1, bits 0-15 changed during input and are invalid.

*Instructions 10 and 11 can be executed only by replacing statements 4.0 and 5.1 (or 7.1). See Teletype printout, page C.18.

Appendix D

GLOSSARY OF TERMS

MF	1700 Computer Main Frame
TTY	1711, 1712, or 1713 Teletypewriter
PTP	1723/1724 Paper Tape Punch
PTR	1721/1722 Paper Tape Reader
DRUM	1751/1752 Drum Controller and Drum
DISK	1738/1739 Disk Controller and 853 Disk Drive Unit
MTAPE	1731 Magnetic Tape Controller and 601 Magnetic Tape Transport
LPRT	1742 Line Printer
UNIT NUMBER	The Unit Number of a Magnetic Tape Transport
CR	1729 Card Reader or Carriage Return
LF	Line Feed
B	Bell on Teletype
Ⓞ cr	A Line Feed followed by a Carriage Return
RELOCATABLE BINARY	The format of output of a compiled or assembled program including control information regarding program name, entry points, externals, transfer address, and command sequence storage. A program in this form may be absolutized by a relocating loader. NOTE: Assembler output tapes are in relocatable form
RUN ANYWHERE PROGRAM	A program which, when absolutized, may be moved elsewhere in core and run at that location successfully. This is accomplished by using relative addressing.

ABSOLUTE TAPE	A tape which is composed of command sequence storage information only. Tapes of this type may be loaded by a Bootstrap Loader.
MSB DRUM	Most significant 16-bits of the two-word, drum address.
LSB DRUM	Least significant 15-bits of the two-word, drum address.
Parameter List	Statement list following the mnemonic. (For the purposes of this manual only.)
BOOTSTRAP LOADER	A short program, normally entered into the computer via the Maintenance Panel, which will read command sequence storage information into core. See paragraph 2.2.2. A Bootstrap is used to initially start up the computer.
STATEMENT	A group of up to eight fields of hexadecimal numbers which, together with the MNE, make up a call for an OLYMPUS subprogram. In the Indirect mode of operation the statement number is included.
LABELED STORAGE	A group of twenty cells which may be referenced by one of the letters G-Z.
DIRECT MODE	A mode of operating OLYMPUS in which each statement input via the TTY is executed immediately.
INDIRECT MODE	A mode of operating OLYMPUS in which a pre-defined sequence of OLYMPUS statements are executed in a user-defined order.
